

**A free app that tells a
storage-heater tenant exactly
what to set the dial to.**

Tonight.

No install. No account. Calibrated against 42 real households, not a guess.

TONIGHT’S CHARGE — SET BY 20:00

Wednesday 9 September

Set input dial to: 1

🔊 “Tonight’s mild. Turn your heater’s input dial right down to 1.”

Before bed, turn your output dial right down too, to its lowest number. This saves tonight’s heat for tomorrow.

Set your dial to 1 tonight instead of leaving it on max — save about £4.02.

Real advice from the live app tonight, for a real UK postcode — recreated here for clarity.

Real households, real overcharging

£110–117

average saving per household, per year

up to £495

for the worst-overcharging real household in the dataset

Measured from real usage, not modelled.

How it actually works

Calibrated on real data

A population-calibrated table built from 42 confirmed storage-heater households' real 2013 usage — not evenly-spaced guesses.

A live forecast, every night

Fetches your postcode's real weather forecast (Open-Meteo) and recalculates tonight's number fresh — nothing is pre-set.

Nothing leaves your device

Your settings and history stay on your own device. Only the coordinates needed for the forecast are ever sent anywhere.

Built for the heaters people actually have

Targets legacy, dial-controlled storage heaters with no smart controller of their own — where a nudge actually changes the outcome.

One real night, captured live

Wednesday 9 September · live forecast for a real UK postcode

15.6°

temp (°C)

10.5

wind (km/h)

1 / 6

dial setting

Mild night, low wind → dial down to 1, save about £4.02 — instead of the heater defaulting to max.

Small on any single night. Real, every night, across a whole winter, is where the £110–117 comes from.

No catch.

- Free to use
- No install
- No account
- No hardware needed

Built as a research prototype for housing associations and local authorities working on storage-heated stock. Feedback very welcome.

Try it on your own postcode.

andymoran.github.io/nightdial

If you work with a housing association or local authority managing storage-heated homes, I'd be glad to hear what you think — and where it falls short.

Part of the same project behind the carbon, cost, and policy series.
